**DETAILED ACTION**

1. Claims 1-20 are presented for examination.

***Specification***

2. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

***Claim Rejections - 35 USC § 102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-20 are rejected under 35 U.S.C. 102(b) as being anticipated by Masenas Jr. (U.S. Patent no. 1983).

Regarding claims 1-20, Masenas discloses a circuit for reducing standby leakage in a memory unit (Figure 1), comprising: a capacitive divider (C4) coupled to the memory unit (10) so as to generate a voltage across the memory unit, the voltage being adequate to retain memory values during one of a sleep state and a standby state (Column 4, lines 1-12), and wherein said capacitive divider is coupled to the memory unit on-chip (Figure 1), and wherein the voltage is a division of a normal operating voltage (Column 3, lines 21-66), and wherein the voltage is substantially  $V_{dd}/2$ , or  $V_{dd}/3$  (Column 3, lines 59-68, Column 4, lines 1-12), and it according to claim substantially  $V_{dd}/3$ , and wherein the capacitive divider is configured for varying an

oscillator frequency in accordance with the generated voltage so as to minimize switching losses (Figure 2, C3,C4), and wherein the memory unit coupled between Vss and Vddinternal terminals (Figure 1), and wherein the memory unit is coupled between Vdd and Vddinternal terminals (Figure 1), and wherein the memory unit is coupled between a first Vddinternal and a second Vddinternal terminal at a different potential (Figure 1).
